

A Comprehensive Measure of Well-Being

Download Required Packages

Open Visual Studio Code and launch the terminal to install all the required Python libraries and dependencies needed for developing the machine learning and Flask-based web application. These libraries are used for data processing, visualization, machine learning model development, and web application deployment. Installing the required packages ensures that the project environment is properly configured and helps avoid errors during coding, training, testing, and execution of the application.

Required Python Libraries

- **pip install numpy**
Used for numerical operations, array handling, and mathematical computations required in data analysis and machine learning.
- **pip install pandas**
Used for data manipulation, preprocessing, cleaning, and handling datasets using DataFrames.
- **pip install matplotlib**
Used for data visualization and plotting graphs, charts, and analytical figures.
- **pip install scikit-learn**
Used for implementing machine learning algorithms, data preprocessing, model training, and evaluation.
- **pip install flask**
Used for building the backend web application, handling routing, and integrating the trained machine learning model with the user interface.

Conclusion

After installing the required libraries, the development environment is fully prepared for building the Comprehensive Measure of Well-Being application. These packages provide the foundation for data analysis, visualization, machine learning model development, and deployment through a Flask web application, enabling efficient and reliable project execution.
