

Project Conclusion

The Human Development Index (HDI) Prediction System demonstrates how Machine Learning and web technologies can be integrated to estimate a country's Human Development Index based on key socio-economic indicators such as Life Expectancy, Schooling, Gross National Income (GNI) per Capita, and Internet Users (%). The application provides a simple and interactive interface that allows users to enter relevant data and instantly receive an HDI prediction.

The project highlights the practical application of data science in supporting human development analysis. By using a trained Linear Regression model and deploying it through a Flask web application, the system offers an accessible way to understand the relationship between development indicators and overall human well-being.

The project provides a strong foundation for future enhancements, including improved prediction accuracy with advanced machine learning models, additional development indicators, data visualization, and cloud deployment.

Overall, the project successfully integrates Machine Learning, Python, Flask, and web technologies to build a functional HDI prediction system while demonstrating practical skills in model development and web deployment.
